# Passport

One Digital Mobility Platform Providing Data & Insights for Operators and Cities.

Passport's digital platform serves as the centralized source and rate engine for mobility transactions and data at the curb. Cities are able to see, manage and make decisions based on all their mobility data, including mobile app & meter payments, enforcement, permits, and more.

With Passport's digital mobility platform, parking operators and city leaders can:

Make Data Driven Decisions: Secure the insights needed to accelerate daily business decisions and project revenue based on those decisions

Drive Revenue: Manage business rules and logic, determine rates and proactively manage compliance based on data and insights available

Manage Data Security: Able to provide a secure management experience of all parking, enforcement and permitting data in one centralized location with the understanding that data belongs to our clients

Provide Safety, Sustainability & Equity: Provide equitable access to all parking and reduce congestion by dynamically managing time spent at the curb

Enhance Customer Satisfaction: Provide full client self service and support for inquiries into accounts. Enhance end customer choice to pay for parking through partnerships that enables customer to use applications they already have

How it Works: Passport's public APIs are able to ingest data from any third party parking and enforcement providers, as well as non-traditional parking transaction sources such as Google Maps, and seamlessly aggregate the data. When a client logs in, Passport's BI tools take the data and provide meaningful insights that parking operators and city leaders can use to better understand how their curb space is being utilized
